

PQP Power Quality Library

The program is started by running **pqpqualitylibrary.exe**.

An example of the opening screen is shown below. If the 'Update' button is visible the collection can be updated from the internet by clicking 'Update' while online. You should do this when using newly supplied media to ensure it is up to date.

On opening, the visible area of the application window is reduced to the title bar positioned at the top edge of the screen. It may be placed wherever the user wishes. Clicking the down arrow will expand the window down or up, depending on where it is positioned.

The display shows a tree containing the resources of the collection. The tree is organised initially according to the file directory structure. Display options can be selected from the 'Arrange' box. For example, the tree may be organised by Topic, Level, Keyword or combinations of these. The originator of the collection determines the options available.

Clicking on a document opens it and the library application reduces again to a title bar. Closing or minimising the selected document allows the application to redisplay.

[This process may be disrupted by MDI applications – such as Word, PowerPoint, etc. In that case, the application state can be toggled by clicking the up/down arrow in the title bar].

Allowing the mouse to hover over a document name in the tree displays a hint containing the assigned Topic and Level.
